

ABSTRACT OF THE DISCLOSURE

A highly precise and durable light source device 10 for a two-dimensional or planar image display does not use a mechanical construction and thus can rapidly move an illuminating point on a light source to a position that best matches the positional movement of an observer. The light source device is provided with an image display means 12. The light source device also includes an LED array 11 of white LEDs 1 or RGB LEDs and an LED control means 13 for performing a turn-on control on the white LEDs in the LED array.
